RF-300D
User Manual

1. Product Description

The RF Label Deactivator / Demagnetizer is designed to deactivate soft RF security labels on paid merchandise, preventing alarms from being triggered when products leave the store.

It works together with the checkout process, allowing simultaneous payment and label deactivation to improve efficiency.

2. How It Works

a) Scan the product barcode at checkout.
b) Place the product with the soft label onto the deactivator.
c) The device will emit a beep sound to confirm that deactivation is successful.

The deactivation process is usually completed together with checkout, so no extra steps are needed.

3. Operating Instructions

a) Connect the device to a power source.
b) Place the label close to the deactivator.
c) Wait for the beep sound, which indicates successful demagnetization.

4. Notes

Keep at least 1.5 meters away from the EAS system.
Do not place on metal surfaces.
Recommended: embed the deactivator in the checkout counter for best performance and a flush surface.

5. Important Notes

Use only on paid merchandise with compatible RF soft labels. Make sure the device is powered and properly installed; if deactivation fails, check the label type, power, and placement.
